

SOLVED EXERCISE 2.1

1. Find the discriminant of the following given quadratic equations:

(i) $2x^2 + 3x - 1 = 0$

Solution:

$$2x^2 + 3x - 1 = 0$$

Compare it with

$$ax^2 + bx + c = 0$$

Here $a = 2, b = 3, c = -1$

$$\text{Disc.} = b^2 - 4ac$$

$$= (3)^2 - 4(2)(-1)$$

$$= 9 + 8$$

$$= 17$$

(ii) $6x^2 - 8x + 3 = 0$

Solution:

$$6x^2 - 8x + 3 = 0$$

Compare it with

$$ax^2 + bx + c = 0$$

Here $a = 6, b = -8, c = 3$

$$\text{Disc.} = b^2 - 4ac$$

$$= (-8)^2 - 4(6)(3)$$

$$= 64 - 72$$

$$= -8$$

(iii) $9x^2 - 30x + 25 = 0$

Solution:

$$9x^2 - 30x + 25 = 0$$

Compare it with

$$ax^2 + bx + c = 0$$

Here $a = 9, b = -30, c = 25$

$$\text{Disc.} = b^2 - 4ac$$

$$= (-30)^2 - 4(9)(25)$$

$$= 900 - 900$$

$$= 0$$

(iv) $4x^2 - 7x - 2 = 0$

Solution:

$$4x^2 - 7x - 2 = 0$$

Compare it with

$$ax^2 + bx + c = 0$$

Here $a = 4, b = -7, c = -2$

$$\text{Disc.} = b^2 - 4ac$$

$$= (-7)^2 - 4(4)(-2)$$

$$= 49 + 32 = 81$$

2. Find the nature of the roots of the following given quadratic equations and verify the result by solving the equations:

(i) $x^2 + 23x + 120 = 0$

Solution:

$$x^2 + 23x + 120 = 0$$

Compare it with

$$ax^2 + bx + c = 0$$

Here $a = 1, b = -23, c = 120$

$$\text{Disc.} = b^2 - 4ac$$

$$= (-23)^2 - 4(1)(120)$$

$$= 529 - 480$$

$$= 49$$

$$= (7)^2 > 0$$

As the disc. is positive and is a perfect square. Therefore the roots are rational (real) and unequal. Verification by solving the equation.

$$x^2 - 23x + 120 = 0$$

$$x^2 - 15x - 8x + 120 = 0$$

$$x(x - 15) - 8(x - 15) = 0$$

$$(x - 8)(x - 15) = 0$$

$$\text{Either } x - 8 = 0 \text{ or } x - 15 = 0$$

$$x = 8$$

$$x = 15$$

thus, the roots are rational (real) and unequal.

(ii) $2x^2 + 3x + 7 = 0$

Solution:

$$2x^2 + 3x + 7 = 0$$

Compare it with

$$ax^2 + bx + c = 0$$

Here $a = 2, b = 3, c = 7$

$$\text{Disc.} = b^2 - 4ac$$

$$= (3)^2 - 4(2)(7)$$

$$= 9 - 56$$

$$= -47 < 0$$

As the Disc. is negative.

Therefore the roots are imaginary and unequal.

Verification by solving the equation

$$2x^2 + 3x + 7 = 0$$

Using quadratic formula

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

$$= \frac{-3 \pm \sqrt{(3)^2 - 4(2)(7)}}{2(2)}$$

$$= \frac{-3 \pm \sqrt{9-56}}{4}$$

$$= \frac{-3 \pm \sqrt{-47}}{4}$$

Thus, the roots are imaginary and unequal.

(iii) $16x^2 - 24x + 9 = 0$

Solution:

$$16x^2 - 24x + 9 = 0$$

Compare it with

$$ax^2 + bx + c = 0$$

Here $a = 16, b = -24, c = 9$

$$\begin{aligned} \text{Disc.} &= b^2 - 4ac \\ &= (-24)^2 - 4(16)(9) \\ &= 576 - 576 \\ &= 0 \end{aligned}$$

As the Disc. is zero.

Therefore the roots of the equation are real and equal.

Verification by solving the equation

$$16x^2 - 24x + 9 = 0$$

Using quadratic formula

$$\begin{aligned} x &= \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \\ &= \frac{-(-24) \pm \sqrt{(-24)^2 - 4(16)(9)}}{2(16)} \\ &= \frac{24 \pm \sqrt{576 - 576}}{32} \\ &= \frac{24 \pm \sqrt{0}}{32} \\ &= \frac{24}{32} = \frac{3}{4} \end{aligned}$$

Thus, the roots are real and unequal.

(iv) $3x^2 + 7x - 13 = 0$

Solution:

$$3x^2 + 7x - 13 = 0$$

Compare it with

$$ax^2 + bx + c = 0$$

Here $a = 3, b = 7, c = -13$

$$\begin{aligned} \text{Disc.} &= b^2 - 4ac \\ &= (7)^2 - 4(3)(-13) \end{aligned}$$

$$= 49 + 156$$

$$= 205 > 0$$

As the Disc. is positive and is not a perfect square.
Therefore the roots are irrational (real) and unequal.
Verification by solving the equation

$$3x^2 + 7x - 13 = 0$$

Using quadratic formula

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

$$= \frac{-7 \pm \sqrt{(7)^2 - 4(3)(-13)}}{2(3)}$$

$$= \frac{-7 \pm \sqrt{49 + 156}}{6}$$

$$= \frac{-7 \pm \sqrt{205}}{6}$$

Thus, the roots are irrational (real) and unequal.

3. For what value of A, the expression $k^2 x^2 + 2(k+1)x + 4$ is perfect square.

Solution:

$$k^2 x^2 + 2(k+1)x + 4 = 0$$

Compare it with

$$ax^2 + bx + c = 0$$

Here $a = k^2$, $b = 2(k+1)$, $c = 4$

Disc. $= b^2 - 4ac$

$$= [2(k+1)]^2 - 4(k^2)(4)$$

$$= 4(k+1)^2 - 16k^2$$

$$= 4(k^2 + 2k + 1) - 16k^2$$

$$= 4k^2 + 8k + 4 - 16k^2$$

$$= -12k^2 + 8k + 4 = 0$$

As the disc of the given expression is a perfect square. Therefore the roots are rational and equal.

So Disc = 0

$$-12K^2 + 8K + 4 = 0$$

$$-(12K^2 + 8K + 4) = 0$$

$$\Rightarrow 12K^2 - 8K - 4 = 0$$

$$12K^2 - 12K + 4K - 4 = 0$$

$$12K(K-1) + 4(K-1) = 0$$

$$(12K + 4)(K-1) = 0$$

Either $12K+4=0$ or $K-1=0$

$$12K = -4$$

$$K = 1$$

$$K = -\frac{4}{12}$$

$$K = -\frac{1}{3}$$

4. Find the value of k , if the roots of the following equations are equal.

(i) $(2k + 1)x^2 + 3kx + 3 = 0$

Solution:

$$(2k + 1)x^2 + 3Kx + 3 = 0$$

Here $a = 2k + 1$, $b = 3k$, $c = 3$

As the roots are equal, So

$$\text{Disc.} = 0$$

$$b^2 - 4ac = 0$$

$$(3k)^2 - 4(2k + 1)(3) = 0$$

$$9k^2 - 12(2k + 1) = 0$$

$$9k^2 - 24k + 12 = 0$$

$$3(3k^2 - 8k + 4) = 0$$

$$\Rightarrow 3k^2 - 8k + 4 = 0$$

$$3k^2 - 6k - 2k + 4 = 0$$

$$(k - 2) - 2(k - 2) = 0$$

$$(3k - 2)(k - 2) = 0$$

Either $3k - 2 = 0$ or $k - 2 = 0$
 $3k = 2$ $k = 2$

$$k = \frac{2}{3}$$

(ii) $x^2 + 2(k + 2)x + (3k + 4) = 0$

Solution:

$$x^2 + 2(k + 2)x + (3k + 4) = 0$$

Here $a = 1$, $b = 2(k + 2)$, $c = 3k + 4$

As the roots are equal, So

$$\text{Disc.} = 0$$

$$b^2 - 4ac = 0$$

$$[2(k+2)]^2 - 4(1)(3k+4) = 0$$

$$4(k+2)^2 - 4(3k+4) = 0$$

$$4(k^2 + 4k + 4) - 12k - 16 = 0$$

$$4k^2 + 16k + 16 - 12k - 16 = 0$$

$$4k^2 + 4k = 0$$

$$4k(k+1) = 0$$

Either $4k = 0$ or $k+1 = 0$
 $k = 0$ $k = -1$

$$(iii) (3k+2)x^2 - 5(k+1)x + (2k+3) = 0$$

Solution:

$$(3k+2)x^2 - 5(k+1)x + (2k+3) = 0$$

Here $a=3k+2$, $b=-5(k+1)$, $c=(2k+3)$

As the roots are equal, So

$$\text{Disc.} = 0$$

$$b^2 - 4ac = 0$$

$$[-5(k+1)]^2 - 4(3k+2)(2k+3) = 0$$

$$25(k^2 + 2k + 1) - 4(6k^2 + 13k + 6) = 0$$

$$25k^2 + 50k + 25 - 24k^2 - 52k - 24 = 0$$

$$k^2 - 2k + 1 = 0$$

$$(k-1)^2 = 0$$

$$\Rightarrow k-1 = 0$$

$$k = 1$$

**5. Show that the equation $x^2 + (mx + c)^2 = a^2$ has equal roots,
 If $c^2 = a^2(1 + m^2)$**

Solution:

$$x^2 + (mx + c)^2 = a^2$$

$$x^2 + m^2x^2 + 2mcx + c^2 = a^2$$

$$(1 + m^2)x^2 + 2mcx + c^2 - a^2 = 0$$

$$(1 + m^2)x^2 + 2mcx + c^2 - a^2 = 0$$

Here $a = 1 + m^2$, $b = 2mc$, $c = c^2 - a^2$

As the roots are equal, so

$$\text{Disc} = 0$$

$$b^2 - 4ac = 0$$

$$(2mc)^2 - 4(1+m^2)(c^2 - a^2) = 0$$

$$4m^2c^2 - 4(c^2 - a^2 + m^2c^2 - a^2m^2) = 0$$

$$4m^2c^2 - 4c^2 + 4a^2 - 4mc^2 + 4a^2m^2 = 0$$

$$-4c^2 + 4a^2 + 4ac^2 + 4a^2m^2 = 0$$

$$-4(c^2 - a^2 - a^2m^2) = 0$$

$$c^2 - a^2 - a^2m^2 = 0$$

$$\Rightarrow c^2 = a^2 + a^2m^2$$

$$c^2 = a^2(a + m^2)$$

Hence proved.

6. Find the condition that the roots of the equation $(my + c)^2 - 4ax = 0$ are equal.

Solution:

$$(mx + c)^2 - 4ax = 0$$

$$m^2x^2 + 2mcx + c^2 - 4ax = 0$$

$$m^2x^2 + 2mcx - 4ax + c^2 = 0$$

$$m^2x^2 + 2(mc - 2a)x + c^2 = 0$$

Here $a = m^2$, $b = 2(mc - 2a)$, $c = c^2$

As the roots are equal, so

$$\text{Disc} = 0$$

$$b^2 - 4ac = 0$$

$$[2(mc - 2a)]^2 - 4(m^2)(c^2) = 0$$

$$4(mc - 2a)^2 - 4m^2c^2 = 0$$

$$4(m^2c^2 - 4amc + 4a^2) - 4m^2c^2 = 0$$

$$4(m^2c^2 - 4amc + 4a^2 - m^2c^2) = 0$$

$$\Rightarrow 4a^2 - 4amc = 0$$

$$4a(a - mc) = 0$$

$$\Rightarrow a - mc = 0$$

$$a = mc$$

Which is the required condition.

7. If the roots of the equation $(c^2 - ab)x^2 - 2(a^2 - bc)x + (b^3 - ac) = 0$ are equal, then $a = 0$ or $a^3 + b^3 + c^3 = 3abc$.

Solution:

$$(c^2 - ab)x^2 - 2(a^2 - bc)x + (b^2 - ac) = 0$$

Here $a = c^2 - ab$, $b = -2(a^2 - bc)$, $c = b^2 - ac$

As the roots are equal so

$$\text{Disc} = 0$$

$$b^2 - 4ac = 0$$

$$[-2(a^2 - bc)]^2 - 4(c^2 - ab)(b^2 - ac) = 0$$

$$4(a^2 - bc)^2 - 4(c^2 - ab)(b^2 - ac) = 0$$

$$4[(a^2 - 2a^2bc + b^2c^2) - (b^2c^2 - ac^3 - ab^3 + a^2bc)] = 0$$

$$a^4 - 2a^2bc + b^2c^2 - b^2c^2 + ac^3 + ab^3 - a^2bc = 0$$

$$\Rightarrow a^4 + ab^3 + ac^3 - 3a^2bc = 0$$

$$a(a^3 + b^3 + c^3 - 3abc) = 0$$

Either $a = 0$ or $a^3 + b^3 + c^3 - 3abc = 0$

$$a^3 + b^3 + c^3 = 3abc$$

Hence proved.

8. Show that the roots of the following equations are rational.

(i) $a(b - c)x^2 + b(c - a)x + c(a - b) = 0$

Solution:

Here $A = a(b - c)$, $B = b(c - a)$, $C = c(a - b)$

Disc $= B^2 - 4AC$

$$= [b(c - a)]^2 - 4[a(b - c)][c(a - b)]$$

$$= b^2(c - a)^2 - 4ac(b - c)(a - b)$$

$$= b^2(c^2 + a^2 - 2ac) - 4ac(ab - b^2 - ac + bc)$$

$$= b^2c^2 + a^2b^2 - 2ab^2c - 4a^2bc + 4ab^2c + 4a^2c^2 - 4abc^2$$

$$= a^2b^2 + b^2c^2 + 4a^2c^2 + 2ab^2c - 4a^2bc - 4abc^2$$

$$= (ab)^2 + (bc)^2 + (-2ac)^2 + 2(ab)(bc) + 2(bc)(-2ac) + 2(-2ac)(ab)$$

$$= (ab + bc - 2ac)^2$$

Hence the roots are rational.

(ii) $(a + 2b)x^2 + 2(a + b + c)x + (a + 2c) = 0$

Here $A = a + 2b$, $B = 2(a + b + c)$, $C = a + 2c$

Disc $= B^2 - 4AC$

$$= [2(a + b + c)]^2 - 4(a + 2b)(a + 2c)$$

$$= 4(a + b + c)^2 - 4(a^2 + 2ac + 2ab + 4bc)$$

$$= 4[a^2 + b^2 + c^2 + 2ab + 2bc + 2ca - a^2 - 2ac - 2ab - 4bc]$$

$$= 4[b^2 + c^2 - 2bc]$$

$$= 4(b - c)^2$$

Hence the roots are rational.

9. For all values of k, prove that the roots of the equation

$$x^2 - 2 \left(k + \frac{1}{k} \right) x + 3 = 0, k \neq 0 \text{ are real.}$$

Solution:

$$x^2 - 2 \left(k + \frac{1}{k} \right) x + 3 = 0$$

$$\text{Here } a = 1, b = -2 \left(k + \frac{1}{k} \right), c = 3$$

$$\begin{aligned} \text{Disc.} &= b^2 - 4ac \\ &= \left[-2 \left(k + \frac{1}{k} \right) \right]^2 - 4(1)(3) \\ &= 4 \left(k + \frac{1}{k} \right)^2 - 12 \\ &= 4 \left[\left(k + \frac{1}{k} \right)^2 - 3 \right] \\ &= 4 \left[k^2 + \frac{1}{k^2} + 2 - 3 \right] \\ &= 4 \left[k^2 + \frac{1}{k^2} - 1 \right] > 0 \end{aligned}$$

Hence the roots are real.

10. Show that the roots of the equation.

$$(b - c)x^2 + (c - a)x + (a - b) = 0 \text{ are real.}$$

Solution:

$$(b - c)x^2 + (c - a)x + (a - b) = 0$$

$$\text{Here } A = (b - c), B = c - a, C = a - b$$

$$\begin{aligned} \text{Disc.} &= B^2 - 4AC \\ &= (c - a)^2 - 4(b - c)(a - b) \\ &= c^2 + a^2 - 2ac - 4(ab - b^2 - ac + bc) \\ &= a^2 + c^2 - 2ac - 4ab + 4b^2 + 4ac - 4bc \\ &= a^2 + 4b^2 + c^2 - 4ab - 4bc + 2ac \\ &= (a)^2 + (-2b)^2 + (c)^2 + 2(a)(-2b) + 2(-2b)(c) + 2(a)(c) \\ &= (a - 2b + c)^2 > 0 \end{aligned}$$

Hence the roots of the equation are real.

Cube roots of unity and their properties.

The cube roots of unity:

Let a number x be the cube root of unity,

$$\text{i.e., } x = (1)^{1/3}$$

$$\text{or } x^3 = 1$$

$$\Rightarrow x^3 - 1 = 0$$

$$(x^3) - (1)^3 = 0$$

$$(x - 1)(x^2 + x + 1) = 0$$

$$[\text{using } a^3 - b^3 = (a - b)(a^2 + ab + b^2)]$$

$$\text{Either } x - 1 = 0 \quad \text{or} \quad x^2 + x + 1 = 0$$

$$\Rightarrow x = 1 \quad \text{or} \quad x = \frac{-1 \pm \sqrt{(1)^2 - 4(1)(1)}}{2(1)}$$

$$x = \frac{-1 \pm \sqrt{1-4}}{2} = \frac{-1 \pm \sqrt{-3}}{2} = \frac{-1 \pm i\sqrt{3}}{2}$$

Three cube roots of unity are

$$1, \frac{-1+i\sqrt{3}}{2} \text{ and } \frac{-1-i\sqrt{3}}{2}, \quad \text{where } i = \sqrt{-1}.$$

Recognize complex cube roots of unity as ω and ω^2 :

The two complex cube roots of unity are $\frac{-1+\sqrt{-3}}{2}$ and $\frac{-1-\sqrt{-3}}{2}$.

If we name anyone of these as ω (pronounced as omega), then the other is ω^2 .

Properties of cube roots of unity:

(a) Prove that each of the complex cube roots of unity is the square of the other.

Proof:

The complex cube roots of unity are $\frac{-1+\sqrt{-3}}{2}$ and $\frac{-1-\sqrt{-3}}{2}$.

We prove that

$$\left(\frac{-1+\sqrt{-3}}{2}\right)^2 = \frac{-1-\sqrt{-3}}{2}$$

$$\text{and} \quad \left(\frac{-1-\sqrt{-3}}{2}\right)^2 = \frac{-1+\sqrt{-3}}{2}$$

$$\left(\frac{-1+\sqrt{-3}}{2}\right)^2 = \frac{1+(-3)-2\sqrt{-3}}{4}$$

$$\left(\frac{-1+\sqrt{-3}}{2}\right)^2 = \frac{1+(-3)+2\sqrt{-3}}{4}$$

$$= \frac{-2-2\sqrt{-3}}{4}$$

$$= \frac{-2+2\sqrt{-3}}{4}$$

$$= \frac{2(-1-\sqrt{-3})}{4}$$

$$= \frac{2(-1+\sqrt{-3})}{4}$$

$$= \frac{1-1-\sqrt{-3}}{2}$$

$$= \frac{-1+\sqrt{-3}}{2}$$

Thus, each of the complex cube root of unity is the square of the other, that is,

$$\text{If } \omega = \frac{-1+\sqrt{-3}}{2}, \text{ then } \omega^2 = \frac{-1-\sqrt{-3}}{2} \text{ and if } \omega = \frac{-1-\sqrt{-3}}{2} \text{ then}$$

$$\omega^2 = \frac{-1 + \sqrt{-3}}{2}.$$

(b) Prove that the product of three cube roots of unity is one.

Proof:

Three cube roots of unity are

$$1, \frac{-1 + \sqrt{-3}}{2} \text{ and } \frac{-1 - \sqrt{-3}}{2}$$

$$\begin{aligned} \text{The product of cube roots of unity} &= (1) \left(\frac{-1 + \sqrt{-3}}{2} \right) \left(\frac{-1 - \sqrt{-3}}{2} \right) \\ &= \frac{(-1)^2 - (\sqrt{-3})^2}{4} = \frac{-1 - (-3)}{4} = \frac{1+3}{4} = \frac{4}{4} = 1 \end{aligned}$$

$$\text{i.e., } (1)(\omega)(\omega^2) = 1 \text{ or } \omega^3 = 1$$

(c) Prove that each complex cube root of unity is reciprocal of the other.

Proof:

$$\text{We know that } \omega^3 = 1 \quad \Rightarrow \quad \omega \omega^2 = 1, \text{ so}$$

$$\omega = \frac{1}{\omega^2} \quad \text{or} \quad \omega^2 = \frac{1}{\omega}$$

Thus, each complex cube root of unity is reciprocal of the other.

(d) Prove that the sum of all the cube roots of unity is zero.

$$\text{i.e., } 1 + \omega + \omega^2 = 0$$

Proof:

The cube roots of unity are

$$1, \frac{-1 + \sqrt{-3}}{2} \text{ and } \frac{-1 - \sqrt{-3}}{2}$$

$$\text{If } \omega = \frac{-1 + \sqrt{-3}}{2}, \text{ then } \omega^2 = \frac{-1 - \sqrt{-3}}{2}$$

$$\begin{aligned} \text{The sum of all the roots} &= 1 + \omega + \omega^2 \\ &= 1 + \frac{-1 + \sqrt{-3}}{2} + \frac{-1 - \sqrt{-3}}{2} \\ &= \frac{2 - 1 + \sqrt{-3} - 1 - \sqrt{-3}}{2} = \frac{0}{2} = 0 \end{aligned}$$

$$\text{Thus, } 1 + \omega + \omega^2 = 0$$

We can easily deduce the following results, that is,

$$(i) \quad 1 + \omega^2 = -\omega \quad (ii) \quad 1 + \omega = -\omega^2 \quad (iii) \quad \omega + \omega^2 = -1$$
